1877. EFFECT OF 3:4-BENZOPYRENE ON FRESHWATER MUSSELS - Wirkung
des 3,4-Benzopyrens auf Süßwassermuscheln - Haranghy L. II. Path. -
Anat., Inst., Med. Univ., Budapest - ACTA BIOL. ACAD. SCIENT. HUNG.
(Budapest) 1956, 7/1 (101-108) Tables 1

The water-purifying ability of the freshwater mussel depends primarily on the
activity of its ciliated epithelium. Preliminary tests showed that the water-
clearing process took 9-11 hr. with all types of mussels used, but when the mussels
were pretreated with benzopyrene (by injection) it took 2-4 days. A general meta-
bolic effect is postulated.

3648. A CASE OF INTRAVENTRICULAR TERATOMA DERIVED FROM THE CHOROID PLEXUS - Haranghy L., Kiszely Gy. and Scholz M. II. Dept. of Pathol. Anat., Histol. and Embryol., Med. Univ., Budapest - ACTA MORPH. ACAD. SCI. HUNG. 1958, 8/2 (209-217) Illus. 15
A 125 g. teratoma located in the right ventricle and originating from the choroid plexus of a 1-month-old infant is described. Epithelial and organic growth characteristics of all 3 primary germ layers were found enclosed in the tumour. From the findings a discussion of the roles played by developmental induction and self-differentiation is developed.

3131. ARTIFICIAL COLLATERAL CIRCULATION BETWEEN SPLEEN AND KIDNEY IN RABBITS: ITS EFFECT ON EXPERIMENTAL NEPHRITIS -
Herbeiführung eines künstlichen Kollateralkreislaufs zwischen Milz und Niere bei Kaninchen und dessen Wirkung auf die experimentelle Nephritis -

Haranghy L., Hedri E., Csillag I., Beregi E. and Jellinek H. II. Inst. für Pathol. Anat. und I. Chir. Klin., Med. Univ., Budapest -

ACTA MORPH. ACAD. SCI. HUNG. 1958, 8/3 (331-336) Illus. 3

In previous studies in dogs (Acta morph. Acad. Sci. hung. 1955, 6, 1) it was shown to be possible, by deep implantation of the kidney in the spleen, to create a collateral circulation which ensured renal function after ligation of the renal artery and vein. Similar experiments in rabbits (50 animals) did not succeed. In a second series of experiments, an attempt was made to bring about favourable circulatory conditions in experimental glomerulonephritis, using the procedure described above. The procedure had no influence on the clinical course or the histological aspects of the glomerulonephritis.

1453. VASCULAR ALTERATIONS IN SPLEENS RESECTED FOR GAUCHER'S DISEASE - Über die Gefäßveränderungen in der wegen Gaucherscher Krankheit entfernten Milz - Harangy L. and Klimko D. H. Inst. für Pathol. Anat. und H. Chir.-Klin., Med. Univ., Budapest - ACTA MED. ACAD. SCI. HUNG. 1959, 14/2 (189-198) Illus. 6

It has not yet been decided whether splenectomy is indicated or not in Gaucher's disease; in an attempt to throw light on this problem, a report is given of the case of a male patient aged 20 yr. The uncertainty concerning whether or not the operation is recommendable is a result of the fact that the disease is of metabolic nature, and enlargement and infiltration of the spleen are only some of the symptoms. In the case here reported, the spleen had been extirpated 12 years previously. Its weight was 1,438 g., the surface was smooth. The cut surface was relatively dry, and showed mostly a pale brownish-red colour, without recognizable structure. Greyish-red spots, ranging from the size of a pinhead to that of a pea, could be seen. There was also an accessory spleen which weighed 22 g. and had the same aspect. Microscopic examination further revealed marked vascular alterations. The media and adventitia of the arteries were thickened; the arterioles of the pulp were mostly obliterated, so that coarse-fibred coil-like formations had developed. The follicular arteries had a thickened intima and media. Their lamina elastica showed fraying and the adventitia was thickened. The sinuses were compressed or dilated. The reticular substance of the pulp showed irregular increases. The fibro-adenia and the vascular alterations are interpreted as indications of portal hypertension. The presence of portal hypertension would render splenectomy advisable regardless of what interpretation is put upon the disease as a whole.

TITLE: Investigation of aging and life span in mussels

SOURCE: Academia scientiarum hungaricae. Acta biologica, v. 16, no. 1, 1965, 57-67

TOPIC TAGS: animal physiology, mollusk, mussel, longevity

ABSTRACT: The life span of various genera of Ostrea, Mytilus, and Anodontia was investigated. Study of mussel shells has shown that their size does not depend on the number of annual rings since environmental conditions influence the size of the animals without affecting their life span. To determine the age of Mytilus, it was necessary to use fluoroscopy and polarization microscopy to differentiate the annual rings. The latter process reveals a pale stripe of double refraction in the area of the annual rings. The following is a table of the longest life spans of various mussels:

Ostrea plicata — 4 yr,
Ostrea edulis — 12 yr,
Mytilus minimus — 4 yr,
Mytilus edulis — 16 yr,

Card 1/2

L 8966-66

ACC NR: AT5028037

Mytilus smaragdinus — 16 yr,
Mytilus chorus — 21—22 yr,
Modiolus modioia — 22—24 yr.

It was concluded that a postreproduction phase of life can be assumed for many species of mussels. Cytological changes in the cerebral ganglia during the aging process were studied in all the species of mussels cited. In addition, the calcium content of Anodonta cygnea tissue was investigated. Experimental results show that in mussels (so-called "telometrically" growing animals) changes in the central nervous system and in the calcium content of connective tissue during aging are similar to such changes in "nontelometric" animals. Budapest, A Magyar Tudomanyos Akademia V. Orvosi Tudomanyok Osztalyanak Kozlemenyei, Vol XVI, No 1, 1965, pages 105-122.

Abstract: The article was presented as the Hogyes Endre memorial lecture, 30 Nov 64. The study underlying the article was made over 20 years ago. Mostly involving the evaluation of malignant diphtheria cases, the conclusion was reached that poor environmental conditions lead to a diminished function of the RES system with a consequent decrease in the resistance of the organism infections. Similar considerations appear to play a role in the high incidence of tuberculosis among the aged. 20 Eastern European, 14 Western references. [Manuscript received 12 Jan 65.]

TITLE: Further investigations concerning functional changes in the adrenal cortex at the resistance stage of the general adaptation syndrome

SOURCE: Academia scientiarum hungaricae. Acta physiologica, v. 27, no. 3, 1965, 265-273

TOPIC TAGS: rat, adrenal gland, corticosteroid, biosynthesis, radiation biologic effect, drug effect

ABSTRACT: The resistance stage of the general adaptation syndrome has been evoked in rats by the repeated administration of formalin, and the resulting functional changes were studied by the invitro incubation of surviving adrenal slices. The aldosterone production was found to be augmented, the corticosterone production unaltered. The production rate of both increased following addition of a progesterone precursor to the incubation medium; after formalin treatment, the increase in aldosterone production was equal to that of the controls while the increase in corticosterone synthesis was more pronounced in the treated animals. After addition of a corticosterone precursor, the rise in aldosterone production was equal in control and formalin-treated groups. These tests afforded an insight into the biosynthesis of adrenocortical steroids in formalin-treated rats and the observations are an argument against the probability of a disturbance in corticosterone-aldosterone transformation. In spite of the quantitative changes, no essential difference in incorporation of the radioactivity into aldosterone and corticosterone was found after the addition of H^3 -progesterone to the incubation medium, nor were any differences observed in the course of disappearance experiments made with H^3 -labelled corticosterone. Orig. art. has 3 figures and 2 tables.

TITLE: Incorporation of the radioactivity of ^3H -progesterone into 18-OH-corticosterone and 18-OH-deoxycorticosterone following treatment with formalin and with hydrocortisone during and after pregnancy ^{B1}

SOURCE: Academia scientiarum hungaricae. Acta physiologica, v. 28, no. 1, 1965, 59-64

TOPIC TAGS: corticosteroid, hormone, endocrinology, rat, biologic reproduction

ABSTRACT: Albino rats were treated with formalin or hydrocortisone. Different groups of animals were killed during pregnancy or a few days after delivery. Surviving sections of their adrenals were incubated with ^3H -progesterone and the radioactivity incorporation into the various corticosteroids was studied.

Special attention was paid to 18-OH-corticosterone and 18-OH-deoxycorticosterone since the quantitative determination of these steroids presents difficulties. The activity (and apparently also the quantity) of 18-OH-corticosterone was increased by formalin treatment; treatment with hydrocortisone failed to produce similar results. The uptake of radioactivity into the corticosteroids produced usually diminished after delivery.

"Results of a Study of the Nutrition of Borderguard Units."

Prague, Vojenske Zdravotnicke Listy, Vol 35, No 5, Oct 66, pp 199-202

Abstract: [Czech, Russian and English summaries, modified]: The diet and nutritional state of borderguard units in spring were studied. Laboratory examinations showed that improper technology in food preparation reduced the nutritional value of the food to 18 percent below the dietary allowance. Blood tests showed vitamin C insufficiency. Levels of vitamin A and carotene were barely adequate. Two Western and 10 Soviet-bloc references.

Title : Saturation of an Organism With Vitamin C and Diuresis.

Orig Pub : Vnitrní lekarství, 1957, 3, No 8, 735-739.

Abstract : The administration to ill people of Tselaskon (I; tablet form of vitamin C) with a calculation of 100 mg 3 times a day was insufficient for the saturation of the organism (especially in the winter months). A daily dose of 1 g of I led to rapid saturation of C and a strong excretion of C with urine. In patients without edema, the saturation of C did not provoke an increase of diuresis. Data were cited on the content of l-ascorbic acid in I; under the action of air, the content of C in I is decreased.

Pf

J. Harasynowicz

Three nomographic methods are presented for the estimation of geometrical dimensions of spiral springs in cases when the force and the corresponding deflection of the spring are specified. One of the nomographs shown has two sliding scales which are first set to take into account the elastic properties of the material of the spring considered, and then the single location line gives the four interrelated quantities: the force, the deflection, and the diameters of the spring and of its wire.

Accumulation of polonium in rat organs and tumor tissue.
László Vekerdi, Antal Haraszti, Gabriella Gerecze, and
Agnes Simonyi (Med. Univ., Debrecen). *Acta Morphol.*
Acad. Sci. Hung. 3, 297-304 (1953).—Polonium chloride in
gelatin was injected intravenously or intraperitoneally into
young adult rats in doses of 0.02-0.03 mc. Frozen sections
of all organs were prepd. and α -ray emissions were detd.
from autographs. The amt. of Po in the liver was const.
from 15 min. to 24 hrs. after its administration, then it de-
creased. The Po in the kidney was about $\frac{1}{3}$ that in the
liver and remained const. from 15 min. to 48 hrs. The ra-
dioactivity in the lungs, spleen, and lymph nodes was con-
siderably lower. The activity in the intestine was initially
quite low but increased 300-400% after several weeks.
Distribution within organs was ~~not~~ uniform except in the
lungs; Po was concd. in the liver in the peripheral areas of
the lobules, in the proximad convoluted tubules of the kid-
ney, and in the pulp of the spleen. The effect of Guerin's
carcinoma, transplanted into rats 3, 11, 14, and 21 days
prior to Po injection, was also detd. In the 3-day tumors,
accumulation of Po was less than in liver, kidney, and
spleen. Eleven and 14-day tumors collected more Po than
surrounding tissue but less than liver. Animals with older
tumors accumulated less Po in the liver than in the tumor.
Hemorrhagic necrotic foci of a tumor showed an increased
accumulation of Po. Fresh and healing wounds showed
high Po activity. P. L. Harris
